SUBSTITUTED BENZANILIDE COMPOUND AND NOXIOUS ORGANISM
CONTROLLING AGENT

5

Technical field

The present invention relates to a novel substituted benzanilide compound and a salt thereof, and a noxious organism controlling agent which comprises the compound as an effective ingredient. The noxious organism controlling agent in the present invention means a noxious insect controlling agent objective to noxious arthropods in the agricultural and horticultural field or stock-raising and hygiene field (a medicine for animals or an insecticide for domestic or business purpose). Also, as the agricultural chemical in the present invention means an insecticide, an acaricide, a nematocide, a herbicide and a fungicide in the agricultural and horticultural field.

15

Background art

Heretofore, it has been known that specific substituted benzanilide derivatives have cytokine production inhibiting activity, vasopressin antagonistic activity, etc., and have been used as a medicine (for example, see WO 98/024771A brochure, WO 99/051580A brochure and JP-A-2002-249473.). Also, it has been known that specific substituted benzanilide derivatives have insecticidal activity (for example, see EP-A-0919542, EP-A-1006107, WO 01/021576A brochure, WO 01/046124A brochure, JP-A-2001-335559, WO 02/062807A brochure, WO 02/094765A brochure, WO 2004/000796A brochure and WO 2004/018415A brochure.). However, there is no disclosure therein about the substituted benzanilide compounds according to the present invention.

DISCLOSURE OF THE INVENTION

Problems to be solved by the invention

Due to use of noxious organism controlling agents such as an insecticide and a fungicide for a long period of time, noxious insects have obtained resistivity thereto in recent years, so that prevention thereof by the conventionally used insecticides or fungicides becomes difficult. Also, a part of the known noxious organism controlling agents has high toxicity, or some of them are putting an ecological system in confusion due to their long residual activity. Under such a circumstance, it has been usually expected to develop a novel noxious organism controlling agent which has low toxicity and low remaining property.

35

Means to solve the problems

The present inventors have conducted earnest studies to solve the above-mentioned problems, and as a result, they have found that the novel substituted benzanilide compound represented by the following formula (1) according to the present invention is an extremely useful compound which has an excellent noxious organism

[8] An insecticide or araricide which comprises one or more kinds selected from the substituted benzanilide compound and a salt thereof according to the above [1] to [4] as an effective ingredient.

Effects of the invention

Due to use of an insecticide or a fungicide for a long period of time, noxious insects have obtained resistivity thereto in recent years, so that it becomes difficult to prevent them by the conventional insecticides or fungicides. Also, in a part of the insecticides, there exist those having high toxicity or having long residual activity in an environment, so that there is a problem that they disturb an ecological system. On the other hand, the compounds of the present invention have excellent insecticidal and acaricidal activities against many agricultural noxious insects and spider mites, and show sufficient preventing effects against noxious insects which obtained resistivity to the conventional insecticides. Moreover, the compounds do not substantially show bad influence against mammals, fishes and useful insects, and are low residual activity so that load against the environment is low.

Accordingly, the present invention can provide a useful and novel noxious organism controlling agent.

After the mixture was stirred at the same temperature for 30 minutes, the solvent was removed under reduced pressure, the residue was dissolved in 10 ml of acetonitrile, 0.5 g of 1-(4-amino-3-methylphenyl)-2-(4-chlorophenoxy)-2,2-difluoro-1-trifluoromethylethanol was added to the mixture, and stirring was continued at room temperature for 5 hours. After completion of the reaction, the solvent was removed under reduced pressure, and the residue was purified by silica gel chromatography eluting with ethyl acetate-chloroform (2:3) to obtain 0.3 g of the objective product as colorless crystals.

Melting point: 65.0 to 75.0°C.

Synthetic example 10

N¹-(2,2-difluoro-3-hydroxy-5-methyl-3-trifluoromethyl-2,3-dihydrobenzofuran-6-yl)-3-iodo-N²-isopropylphthalic diamide(Present compound No.4-002).

Step 1; Preparation of 1-(2-bromo-1,1,2,3,3,3-hexafluoropropoxy)-4-methyl-3-nitrobenzene

To 100 ml of an N,N-dimethylformamide solution containing 10.0 g of 2,2-dibromo-1,1,2,3,3,3-hexafluoropropane and 5.0 g of 4-methyl-3-nitrophenol was added 1.4 g of 60% oily sodium hydride under ice cooling and stirring, and the mixture was stirred at room temperature for 12 hours. After completion of the reaction, the reaction mixture was poured into 300 ml of ice-water, extracted with 150 ml of diethyl ether, the organic layer was dehydrated and dried by saturated saline solution and then anhydrous magnesium sulfate in this order, and the solvent was removed under reduced pressure. The residue was purified by silica gel chromatography eluting with ethyl acetate-hexane

(1:4) to obtain 8.0 g of the objective product as pale yellowish oily substance.

Step 2; Preparation of 5-(2-bromo-1,1,2,3,3,3-hexafluoropropoxy)-2-methylaniline

To 100 ml of an ethanol solution containing 8.0 g of 1-(2-bromo-1,1,2,3,3,3-hexafluoropropoxy)-4-methyl-3-nitrobenzene were added 9.5 g of tin chloride
 5 dehydrate and 15 ml of conc. hydrochloric acid at room temperature under stirring, and the mixture was stirred at the same temperature for 12 hours. After completion of the reaction, the solvent was removed under reduced pressure, the residue was poured into 100 ml of 2N aqueous sodium hydroxide solution, extracted with 100 ml of diethyl ether, the organic layer was dehydrated and dried by saturated saline solution and then
 10 anhydrous magnesium sulfate in this order, and the solvent was removed under reduced pressure. The residue was purified by silica gel chromatography eluting with ethyl acetate-hexane (1:4) to obtain 6.0 g of the objective product as pale yellowish oily substance.

Step 3; Preparation of 6-amino-2,2,3-trifluoro-5-methyl-3-trifluoromethyl-2,3-dihydro-
 15 benzofuran

To 50 ml of a dimethylsulfoxide solution containing 6.0 g of 5-(2-bromo-1,1,2,3,3,3-hexafluoropropoxy)-2-methylaniline were added 2.2 g of sodium hydrogen carbonate and 4.5 g of sodium dithionite under stirring, and the mixture was stirred at 70°C for 3 hours. After completion of the reaction, the reaction mixture was poured
 20 into 300 ml of ice-water and extracted with 150 ml of diethyl ether, the organic layer was dehydrated and dried by saturated saline solution and then anhydrous magnesium sulfate in this order, and the solvent was removed under reduced pressure. The residue was purified by silica gel chromatography eluting with ethyl acetate-hexane (3:7) to obtain 3.0 g of the objective product as colorless oily substance.

Step 4; Preparation of 6-amino-2,2-difluoro-3-hydroxy-5-methyl-3-trifluoromethyl-2,3-dihydrobenzofuran

1.0 g of 6-amino-2,2,3-trifluoro-5-methyl-3-trifluoromethyl-2,3-dihydrobenzofuran was treated by alumina column chromatography eluting with ethyl acetate-methanol (7:3) to obtain 0.6 g of the objective product as white crystals.

Step 5; Preparation of N¹-(2,2-difluoro-3-hydroxy-5-methyl-3-trifluoromethyl-2,3-dihydrobenzofuran-6-yl)-3-iodo-N²-isopropylphthalic diamide

To 5 ml of a toluene solution containing 0.6 g of 3-iodo-N-isopropylphthalamidic acid was added dropwise 0.6 g of trifluoroacetic anhydride at room temperature under stirring. After the mixture was stirred at the same temperature for 30 minutes, the
 35 solvent was removed under reduced pressure, the residue was dissolved in 10 ml of acetonitrile, 0.5 g of 6-amino-2,2-difluoro-3-hydroxy-5-methyl-3-trifluoromethyl-2,3-dihydrobenzofuran was added to the mixture, and stirring was continued at room temperature for 5 hours. After completion of the reaction, the solvent was removed under reduced pressure, and the residue was purified by silica gel chromatography
 40 eluting with ethyl acetate-chloroform (1:1) to obtain 0.4 g of the objective product as colorless crystals.

Melting point: 144.0 to 146.0°C.

Present compounds can be prepared according to the above-mentioned Preparation method and Examples. Examples of such compounds are shown in Table 6 to Table 10, but the present invention is not limited by these.

Incidentally, in the Tables, i-Pr means an isopropyl group, and in the same manner, s-Bu means a secondary butyl group, t-Bu means a tertiary butyl group, Ph means a phenyl group, and 2-Naph means a 2-naphthyl group, respectively,

in the Tables, aromatic heterocyclic rings represented by L-15b to L-45e have the following structures, respectively.

For example, the expression [(D-15b)CF₃] means 1-methyl-5-trifluoromethyl-pyrazol-3-yl group, and the expression [CH₂(L-36a)] means 1,2,4-triazol-1-yl methyl group.

Also, in the tables, *1 means "resinous state", and *2 means "oily state", respectively.

[Test examples]

Next, usefulness of the compound of the present invention as a noxious organism controlling agent is specifically explained in the following Test Examples, but the present invention is not limited by these alone.

5 Test Example 1 Insecticidal test against diamondback moth

A 10% emulsifiable concentrate (depending on the compounds, 25% wettable powder was applied for the test) of the compound of the present invention was diluted with water containing a spreading agent to prepare a chemical solution with a concentration of 100 ppm. To the chemical solution was dipped leaves of Chinese
 10 olive for about 10 seconds, and after air-drying, they were placed in a laboratory dish, then, 10 diamondback moths (*Plutella xylostella*) with second instar larvae per the dish were released therein, and the dish was covered with a lid having holes and contained at a thermostat chamber at 25°C. A number of dead insect(s) after 6 days was counted and a rate of dead insects was calculated in the same manner as in Test
